This blockage prevents the passage of liquids and food from the stomach into the rest of the intestine. Patients with duodenal atresia require complex surgery. The cause of duodenal atresia is not known. It is congenital, meaning it happens before your baby is born. Duodenal atresia is a narrowing or blockage in the duodenum. Duodenal atresia can sometimes be discovered during pregnancy as it often shows up on ultrasound. This stops food and fluid passing from the stomach into the intestines. This stops food and fluid passing from the stomach into the intestines. Intrinsic duodenal obstruction (DO) caused by atresia or stenosis is the most common cause of congenital intestinal obstruction and is estimated to occur in 1 in 10,000 live births. With the rising popularity of laparoscopic surgery, duodenal atresia, one of the forms of CDO, can also be treated. At initial operation, duodenal atresia was noted in instances and duodenal stenosis in 100 babies had a mucosal atresia, had a fibrous cord. Duodenal atresia is classified into three types: type I (duodenal diaphragm) is linked to the presence of a mucosal diaphragmatic membrane with an intact muscle wall; type II Duodenal atresia is a congenital intestinal obstruction that can cause bilious or non bilious vomiting within the first 24 hours of neonatal life, typically following the first oral feeding. Duodenal atresia means the duodenum (first part of the small intestine just beyond the stomach) is closed off rather than being a tube. Duodenal atresia develops out of every 6, live births. Duodenal atresia is a form of CDO that occurs due to failure of the solid core of the duodenum to recanalize during fetal development.
