Convenience sampling often helps to Convenience sampling is a common form of sampling found in population research and particularly in prehospital and disaster research. Convenience sampling is a non-probability sampling method that involves selecting participants based on their easy availability or accessibility to the researcher In this This article studied and compared the two nonprobability sampling techniques namely, Convenience Sampling and Purposive Sampling. This sampling technique often selects clinical cases or participants Convenience sampling is one of the non-probability sampling techniques and a way of selecting participants from the target population based on ease of access (Golzar, Noor and Tajik,). Convenience Sampling and Convenience sampling Convenience sampling is selecting participants because they are often readily and easily available. Despite the limitations of convenience sampling, there are steps that can be taken to improve credibility of this popular and simple method (Table 1) Convenience sampling is a non-probabilistic sampling technique applicable to qualitative or quantitative studies, although it is most frequently used in quantitative studies Typically, convenience sampling tends to be a favored sampling technique among students as it is inexpensive and an easy option compared to other sampling techniques (Ackoff,). Typically, convenience sampling tends to be As an overview, convenience sampling is a form of non-probability sampling commonly used for population and clinical research. Convenience sampling is popular because it is not costly, not as time consuming as other sampling strategies, and simplistic When used to generate a potential hypothesis or study objective, convenience sampling is useful. The Convenience sampling Convenience sampling is selecting participants because they are often readily and easily available. Convenience sampling is subject to multiple Convenience sampling is non-probability sampling that is often used for clinical and qualitative research.
