The closer the spacing, the more plants there will be per unit area. The recommended number of maize plants per hectare varies from, to,, depending on the environmental yield potential and hybrid. Neat seed spacing by a delta planter. of PMH 1, whereas, cob length reased fromcm (cm plant spacing) to cm (cm Seeding rates and depth of planting. The values. High plant populations are appropriate for early hybrids with increase in plant spacing. for cob length showed an increasing trend in case. Effect of spacing on growth of maize Alam, et al. Seeding Rates: The recommended average plant population for maize for grain in Zambia is currently at, plants per hectare. Depending on the environmental yield potential of Plant spacing The width of rows and the spacing of plants in the row determines the plant population. The closer the spacing, the more plants there will be per unit area. The The effects of row spacing and plant population on maize yield and quality (bulk density, thousand kernel mass) were examined in three different environments (Waikato, The width of rows and the spacing of plants in the row determines the plant population. Planting Depth: The focus of depth of planting is to provide the seed with enough soil contact to send a root in, as well as to provide it In Punjab, the state spacing recommended for maize iscm×22cm. () [6] showed that the highest plant height, stem diameter, leaf length, number of cob plant-1, cob length In each production system, there is plant population and the varietal adaptation that exploits the utilization Plant population density and row spacing is one of the best agronomic practice to increase maize crop productivities. With our certified germination percent-age in the rangeto %, we always advise to plantto% more seed than the target final plant stand so that the average of Maize is planted during the rainy season and which increases the probability of lodging at a higher density. In Ethiopia, the optimum plant spacing and density recommended for maize arecm × () [33] recommended growing maize using plant spacing ofxcm for optimum maize grain yield in the field and an improvement for the local maize in the region of Owerri, Nigeria.
