The overall charge can be positive, negative, or neutral. For coordination compounds that are ionic (i.e., the coordination complex is either an anion Nomenclature of Coordination Complexes A coordination complex is a substance in which a metal atom or ion accepts electrons from (and thus associates with) a group of neutral molecules or anions called ligands. Coordination compounds are complex or contain complex ions. A ligand can be an anion or a neutral molecule that donates an electron pair to the complex (NH₃, HO, Cl⁻) A complex can be an anion, a cation ion, or a neutral molecule 2 COMPLEXES AND ADDITIVE NOMENCLATURE Overall approach Additive nomenclature was developed in order to describe the structures of coordination entities, or complexes, but this method is readily extended to other molecular entities as well. Mononuclear complexes are considered to consist of a central atom, often a metal Coordination complexes consist of a ligand and a metal center cation. For coordination compounds that are ionic (i.e., How to name complex ions that are positively charged. Nomenclature of Coordination Complexes. The name of the transition metal comes at the end of the name along with a Roman numeral indicating its charge Peu de métaux possèdent le même nombre de coordination dans tous les complexes: c'est le cas de Co³⁺ où n=dans [Co(NH₃)₆]³⁺, [Co(en)₆]³⁺, [Co(NH₃)₄Cl₂]⁺ Le Nomenclature of Coordination Complexes. Rule The names of neutral coordination complexes are given without spaces. A coordination complex is a substance in which a metal atom or ion accepts electrons from (and thus associates with) a group of neutral 2 COMPLEXES AND ADDITIVE NOMENCLATURE Overall approach Additive nomenclature was developed in order to describe the structures of coordination entities, Title: Microsoft Word NOMENCLATURE DES COMPLEXES DE Author (S\bastien Bruneau) Nomenclature of Coordination Complexes Rule The names of neutral coordination complexes are given without spaces.
