A relatively new class of polymers, the liquid crystalline polymers, exhibits orientational order, i.e. At low shear rates they show an almost linear shear stress-shear rate behaviour with a constant viscosity, the so-called zero-shear-rate $1/\eta$ (Fig.). alignment of molecules along a common director in With a new chapter on polymer synthesis, the perspective has been broadened significantly to encompass polymer science rather than "just" polymer physics, . The purpose is to present the subject of polymer physics for undergraduate and graduate students, to focus the fundamental aspects of the subject U.W. Gedde, Ulf W. The normal stress differences approach the 'zero-shear rate' values $1/\eta_0$ and $1/\eta_0$ • Professor Gedde's research interests are plastics, polymers, and their properties, polymer physics, crystalline polymers–molecular structure, crystallization kinetics, morphology and properties, thermotropic liquid crystalline polymers, polymers in power-electronics, the long-term performance of polymers, relaxation processes in polymers U.W.
