Structurally and neurochemically, the enteric nervous system (ENS) is a brain unto itself. Michael Gershon, investigator at the University of Columbia, in the United States, and author of *The Second Brain*, a reference book on the investigations about the topic, explains that Dr. Michael Gershon has devoted his career to understanding the human bowel (the stomach, esophagus, small intestine, and colon). Although initially considered as a simple collection of ganglia, it is now recognized that the ENS is a center of autonomous activity neuronal that can function independently of the central nervous system. In addition to numerous scientific publications, he is the author of *The Second Brain* (Harper Collins, New York.). Although initially considered as a simple collection of ganglia, Dr. Gershon is Professor and Chair, Department of Anatomy and Cell Biology, Columbia University College of Physicians and Surgeons, New York. His thirty years of research have led to an extraordinary rediscovery: nerve cells in the gut that act as a brain. The document describes the enteric nervous system (ENS) as a "second brain" complex. Our two brains—the one in our head and the one in our gut—will interact. In addition to numerous studies, it will confirm the influence of the second brain on impulsivity and its collateral damage in the organism. The ENS contains a sophisticated neural network that uses more neurotransmitters. This brain, according to recent scientific studies, influences our mood, character and even our sleep rhythm.
