It covers the determination of yield strength, tensile strength, elongation, and reduction of area. Scope\* These test methods cover the tension testing of metallic materials in any form at room temperature, specifically, the methods of determination of yield strength, yield point elongation, tensile strength, elongation, and reduction of area. The gage lengths for most round specimens are required to be 4D for E8 and 5D for E8M. Scope\* These test methods cover the tension testing of metallic materials in any form at room temperature, specifically, the methods of determination of yield strength, yield point elongation, tensile strength, elongation, and reduction of area. Tension Testing of Metallic Materials This standard is issued under the fixed designation E8/E8M; the number Scope\* These test methods cover the tension testing of metallic materials in any form at room temperature, specifically, the methods of determination of yield strength, , · Go to ASTM Compass®. Note A complete metric companion to Test Methods E has been developed, therefore, no metric ASTM E8/E8M requires that extensometers conform to ASTM E. MTS offers a variety of extensometer types, ranging from clip-on, automatic to non-contacting optical and video extensometers, that meet or exceed requirements for calibration according to ASTM E. Class B1 and ISO Class standards ASTM E is a standard test method for tension testing of metallic materials. An American National Standard. This standard is widely used in various industries and research fields to evaluate the mechanical properties of metals. It covers the determination of yield strength, tensile strength, elongation, and reduction of area. Standard Historical Last Updated: Track Document. ASTM E Standard Test Methods for Tension Testing of Metallic ASTM E8/E8M measures the tensile properties of metallic materials in any form at an ambient temperature between –degrees Celsius (– degrees Fahrenheit) Missing: pdf ASTM E is a standard test method for tension testing of metallic materials. Standard Test Methods for. NOTE 1—A complete metric companion to Test Methods E has been developed, therefore, no Scope These test methods cover the tension testing of metallic materials in any form at room temperature, specifically, the methods of determination of yield strength, yield point elongation, tensile strength, elongation, and reduction of area.
