and sensory dysfunction. Neurology., · Abstract: Brown-Séquard Syndrome (BSS) is a rare spinal cord injury characterized by asymmetrical motor. This lesion leads to interruption of normal function of nerve tracts in one half of the spinal cord [2] BSS was described in by Charles-Edouard Brown-Sequard after experimentation with spinal cord hemisection in animalsThere are three mechanisms by which a spinal cord injury (SCI) is propagated following penetrating spinal injury. First, direct damage caused by the weapon or bony fragments causes permanent physical cord damage Brown-Sequard syndrome, was published in in his monograph 'Experimental and clinical researches in the physiology and pathology of the spinal cord'Before publication Trauma to the spinal Brown-Sequard performed research on the autonomic disturbances, epilepsy, endocrine glands and pulmon-ary circulation.2,3 The article by Fernandez-Torron et aldescribes 'Brown-Sequard-Plus' syndrome is appreciated more frequently, wherein there is a relative ipsilateral hemiplegia paired with a relative contralateral hemianalgesiaBSS is Brown-Séquard syndrome (BSS) is a rare and treatable condition that happens when damage to your spinal cord causes weakness or paralysis on one side of your body and Missing: pdf Brown-Séquard's paralysis. Specialty. It manifests with weakness or paralysis and proprioceptive deficits on the side of the body ipsilateral to the lesion and loss of pain and temperature sensation on the contralateral side Brown-Séquard syndrome (BSS) is a rare neurological condition that happens when damage to your spinal cord causes muscle weakness or paralysis on one side of your body and a loss of sensation on the opposite side. Brown-Séquard syndrome (also known as Brown-Séquard's hemiplegia, Brown-Séquard's paralysis, hemiparaplegic Brown-Séquard syndrome is a neurologic syndrome resulting from hemisection of the spinal cord. The damage occurs on only one side of your spinal cord in a specific area Brown-Sequard Syndrome (BSS), an incomplete spinal cord injury, is a neurological condition that results from a hemisection to the spinal cord [1] on either side, typically in the cervical and thoracic spinal cord region.
