Teacher can reference *Pioneers of Climate Change* research. Before humans released CO₂ Carbon is the basis for life on Earth – people are percent carbon and plants are percent carbon, for example. Simple energy balance indicates that the expected average surface temperature should be 15°C, but the observed value is 15.5°C. The cycle can be described in terms of stores of carbon and the processes that govern exchanges between them by the natural carbon cycle, but it has been disrupted beyond natural fluctuations. Carbon Cycle Game: Students play a game in which they take on the role of carbon atoms. Carbon is the basis for life on Earth – people are percent carbon and plants are percent carbon, for example. +15.5°C The carbon cycle How carbon atoms move between organisms and the air Learner's Book: Questions Think like a scientist: How do plants and animals affect All life on Earth is based upon carbon. Teacher can reference this document for background information and other source material about the carbon cycle. The rate of CO₂ transfer is also a product of how much CO₂ is inside the leaf Teacher facilitates the carbon cycle game using the following resource: The Carbon Cycle Game Supporting Document Background Information. The element is considered key to Earth's habitability The CO₂ used in this process gets into the interior of the leaf through small openings about microns in diameter called stomata, which the plant can control like a valve, Teacher facilitates the carbon cycle game using the following resource: The Carbon Cycle Game Supporting Document Background Information. The carbon cycle describes a set of processes governing the movement of carbon elements or compounds through living organisms and the environment and how carbon is stored and released in various ways. The element is considered key to Earth's habitability The CO₂ used in this process gets into the interior of the leaf through small openings about microns in diameter called stomata, which the plant can control like a valve, opening and closing to adjust the rate of transfer. It is therefore essential to better understand the cycle in order to project future climate change The natural carbon cycle The Earth has an active natural carbon cycle, inhaling and exhaling carbon like a living organism.
