Many natural hazards are interrelated, for example, earthquakes can cause tsunamis and hurricanes Disasters take various forms ranging from natural disasters, such as tornados, to man made disasters, such as workplace violence, and happen on a far too frequent basis. It describes processes that have potential to cause natural disasters. Floods, like other disasters, do not qualify to be labelled 'disasters' by the mere virtue of their happenstances. Disaster is a sudden, calamitous event bringing great damage, loss, destruction and This entry presents an overview of origins, impacts, and management of natural disasters. Unfortunately, the trend is an upward oneA disaster is a sudden, calamitous event that seriously disrupts the functioning of a community or society and causes human, material, and economic or environmental losses that exceed the Natural Disasters: Causes, Consequences and Its Preventive Role in Sustainable Development. They do become disasters when they cause damage or adverse effects to Disaster management can be defined as the organization and management of resources and responsibilities for dealing with all humanitarian aspects of emergencies, in particular The object of disaster risk science research is the "disaster system" consisting of hazard, the geographical environ-ment, and exposed units, with features of regionality, scientists studied on the classification, temporal and spatial patterns, and causes of hazards. Disaster is defined as a crisis situation causing wide spread damage which far exceeds our ability to recover. Refer to research in Every year disasters take lives, cause significant damage, inhibit development and contribute to conflict and forced migration. These include hurricanes, forest fires, floods, tornados, earthquakes, landslides, ice storms, and volcanic eruptions. In this section, we will focus on the different classifications of hazards. Rayees Ibrahim Lone*, Dr. S. SubramaniABSTRACT. No matter what type of disaster befalls individuals, organization or country, the results are typically the same, i.e., substantial loss of life, assets and productivity Natural hazards are threats of a naturally occurring phenomenon that will have a negative effect on people or the environment. It outlines a brief history of impacts of natural hazards on the human built environment and the common techniques adopted for natural disaster preparedness PREFACE.
