Changes in This Release for Oracle Database Concepts Users interact with database systems through query languages. The query lan-guage of a DBMS has two broad tasks: to define the data structures that serve as receptacles for the data of the database, and to allow the speedy retrieval and modification of data. Accordingly, we distinguish between two components data redundancy:a situation that occurs in a database when a fieldneeds to be updated in more than one table database approach: allows themanagement of large amounts of organizational information database management software:a powerful software tool that allows you to store, manipulate and retrieve data in a variety of ways Section describes important data structures used during query evaluation.
