Severe acute pancreatitis (SAP) characterized by persistent organ failure (OF, >h) is a life-threatening illness with a mortality rate as high as %-% and incurs an increasingly heavy burden of high healthcare costs [[1], [2], [3]]. At least half of the deaths in SAP occur as early as the first two weeks and are The UK incidence of acute pancreatitis (AP) is estimated as cases perper year and is rising by % each year AP has a mortality rate of 1%-7% which increases to around% in patients with pancreatic necrosis The mortality rate is influenced by the severity of the disease with several prognostic factors having been Forty-three patients with a diagnosis of acute pancreatitis (acute abdominal pain and a serum amylase > IU/liter) were sequentially allocated to treatment with high dose weeks after the second dose (for a total of weeks). At weeks, the average reduction in triglyceride levels in plozasiran treated patients was%, compared with% in The adult literature suggests boluses of to mL initially, and up toto 4L fluids within first hours. Recommendation 2aii: Children with diagnosis of acute pancreatitis should be provided totimes maintenance IV fluids with monitoring of urine output over the nexttohours , ·Introduction.
