These include the Personality Assessment Inventory– Borderline Subscale (PAI-BOR, Morey,), the Personality Abstract. Expand Borderline personality disorder (BPD) is frequently conceptualized as an extreme variant of normal personality traits. A previous study successfully developed Next, we tested the association between our new scale—the Minnesota Borderline Personality Disorder Scale (MBPD)—and external correlates empirically associated with BPD, such as childhood trauma, behavioral disinhibition, and substance use The authors determined the construct validity of the MBPD scale by examining its association with (a) diagnosed BPD, (b) questionnaire-reported BPD symptoms, and (c) clinical variables associated with BPD: suicidality, trauma, disinhibition, internalizing distress, and substance use The authors determined the construct validity of the MBPD scale by examining its association with (a) diagnosed BPD, (b) questionnaire-reported BPD symptoms, and (c) clinical variables A previous study successfully developed and validated a BPD measure embedded within a normal trait measure, the Minnesota Borderline Personality Disorder Scale (MBPD) A further validation of the Minnesota Borderline Personality Disorder Scale was performed by examining its convergent validity, external correlates, and heritability in a sample of female twins. Diagnostic The authors determined the construct validity of the MBPD scale by examining its association with (a) diagnosed BPD, (b) questionnaire-reported BPD symptoms, and (c) established measures of borderline personality symptoms. McGue ( ) developed the Minnesota Borderline Personality Disorder Scale (MBPD) using items from the MPQ pool with cross-validated correlations to other indicators of BPD Measures are organized into three categories: (a) the Minnesota Borderline Personality Disorder Scale, (b) convergent validity measure, and (c) external correlates.
