To assess and compare the suitability of Moberg pickup test (MPUT) and button test (BT) as indicators for functional impairment in patients with inflammatory joint Objective. Moberg pickup test (MPUT) is a standardized test to assess for hand dexterity and functional sensibility. No subjects had a history of upper extremity dysfunction. Both hand J HAND THER, gers used to pick up the objects and the time taken to accomplish the task are usually noted lon-modified Moberg pick-up test (DMPUT) to quantify dexterity at the onset of treatment and compare scores with es-tablished norms. Conclusion: Females performed the test faster than males, and task The purpose of this study was to propose a standard protocol for administering the Moberg pickup test. The materials and the testing procedures were clearly described to the subjects. Eyes open and close on dominant hand and Non dominant hand. Result: The results sho. ith mean values of, and, respectively. It is simple and quick to administer, easy to replicate, and inexpensive to acquire. Abstract. It is simple The Moberg Picking-Up Test (MPUT) was developed by Moberg in to assess the ability and skill of the hand to identify small objects, with and without using the vision Objective. It is a timed test first used in neuro-rehabilitation to evaluate hand motor activity. that the hand dexterity of the subjects was significantly good. It is simple and quick to administer, easy to replicate and inexpensive to acquire. Moberg defined hand function as precision sensory and gross sensory grip.! Administered with a standard protocol, the Moberg pickup test is a valuable test of functional sensibility. The purpose of this study was to propose a standard protocol for administering the Moberg The inter-rater reliability of the test was also determined. A wide variety of occupations were represented. He reasoned that whenever precision sensory grip is possible, pro-TECTIVE sensation is always This paper is only available as a PDF. To read, Please Download here. [1] Administered with a standard protocol, the Moberg pickup test is a valuable test of functional sensibility. Cli- r analysis to obtain the normative values for Mobergpickup test. Clinicians should not use the PPB test, Jebsen-Taylor Hand Function Test, or the Nine-Hole Peg Test to assess clinical change following carpal tunnel release (CTR) surgery. One hundred subjects (male andfemale subjects, agedtoyears) volunteered.
