For reference, the baseline enrollment EF for all original patients at entry into the SCD-HeFT trial was% The major objective of the present analysis of data from the Sudden Cardiac Death in Heart Failure Trial (SCD-HeFT) was to determine the incidence of and risk factors for thromboembolism in stable, moderately symptomatic patients with systolic heart failure without a history of AF or atrial flutter. CCF (NYHA II/III; LVEF<30%) The Sudden Cardiac Death in Heart Failure Trial (SCD-HeFT) was designed to evaluate the hypothesis that amiodarone or a conservatively programmed shock-only, single-lead ICD would reduce the risk of death from any cause in a broad population of patients with mild-to-moderate heart failure. The SCD-HeFT trial showed that among patients with NYHA class II or III CHF and reduced LVEF, treatment with an ICD was associated with a reduction in all-cause mortality compared with placebo, but there was no difference between amiodarone and placebo. Objectives. Long-Term Outcomes of Implantable Cardioverter-Defibrillator Therapy in the SCD-HeFT Free Access. Population. Clinical Perspective p Placebo. Jeanne E. Poole., Brian Olshansky., Daniel B In this analysis, we sought to determine the distribution of multimorbidity scores in patients enrolled in SCD-HeFT (Sudden Cardiac Death in Heart Failure Trial) and tested the 1 day ago · SCD-HeFT Operations Manual Table of Contents Table of Contents Table of Contents Study Contacts Study Overview Patient Enrollment/Inclusion/Exclusion The major objective of the present analysis of data from the Sudden Cardiac Death in Heart Failure Trial (SCD-HeFT) was to determine the incidence of and risk factors for Control. Original Investigation. The Sudden Cardiac Death in Heart Failure Trial (SCD-HeFT) was designed to evaluate the hypothesis that amiodarone or a conservatively programmed shock-only, single-lead implantable cardioverter defibrillator (ICD) would reduce the risk of death from any cause in a broad population of patients with mild-to-moderate heart failure The median last known EF was % for all randomized groups and was assessed at a median (25th to 75th percentiles) of years (to years) from SCD-HeFT trial end (Supplemental Table 2).
