Shi et al prepared a hydrogel occluding agent by the graft polymerization of acrylamide on a metal tube. Iteration techniques showed that for the three chosen techniques, the following parameters need to be considered: yields, flow rate, the feedstock variation, clarity of the liquid phase, and solids content in the liquid [8]. The present study aims to deal with the PAS issue, by focusing only on applied requirements for industrial uses. Analytical techniques are used to follow the course of reactions and determine purity of products. These methods include gas chromatography (GC), high-performance liquid chromatography (HPLC), and thin-layer chromatography (TLC) three isoconversional methods, and considered that a high heating rate could promote the pyrolysis of oil sludge. In the thermal composition stage, the apparent activation energy increased with the increased conversion. Chromatographic techniques fall into one of two categories: analytical and preparative.
