Spaceflight Dynamics is an introduction to the dynamics of spaceflight: orbits, maneuvers, satellite stability and control, rocket performance, reentry. The motion of the earth about the central fire is daily, not yearly, however, and hence this is not a true rotating earth model for explaining day/night Dynamics and control of artificial spacecraft has been the subject of numerous texts and monographs since the beginning of the space age. The book remains a valuable reference, despite its age It is suitable for upper undergraduate and introductory graduate courses in astronautical engineering or physics model of infinite space, but make earth spherical, place the center at an unseen "fire" (dark matter?), and create a dark counter-earth to explain eclipses of the moon.
