Introduction Much like early theories of intelligence, the first notions of self-concept emphasized a The Tennessee Self-Concept Scale (TSCS) is a self-report, multidimensional measure of self-concept. An overall score can be calculated for self-concept, for Ninety of the items relate to one of five areas of the The construct validity of responses to the Tennessee Self-Concept Scale (TSCS) was evaluated in two sets of analyses. , · The construct validity of responses to the Tennessee Self-Concept Scale (TSCS) was evaluated in two sets of analyses. First, exploratory and confirmatory factor analyses, and an analysis of variance model adapted from multitrait-multimethod (MTMM) research, were used to examine the internal structure of the TSCS responses. The Tennessee Self-Concept Scale (TSCS) is a self-report, multidimensional measure that aims to capture this construct. First, exploratory and confirmatory factor The Tennessee Self-Concept Scale has been used in two studies to measure identity in people with dementia (Addis & Tippett, ; Naylor & Clare,). It consists of , · The Tennessee Self-Concept Scale (TSCS) contains items and scales designed to assess self-concept in three areas: total self-esteem, self The Tennessee Self-Concept Scale, one of the most popular measures of self-concept in children, adolescents, and adults, offers norms down to age 7, easy scoring procedures, 5, · Academic Self-Concept Scale for Adolescents (ASCS) The Academic Self-Concept Scale for Adolescents (Minchekar,) was developed in response to Self-concept refers to the entirety of an individual's thoughts and feelings about the self (Rosenberg). It consists of statements which are rated on a point scale for self-descriptiveness, from "always false" to "always true". It was developed by William H. Fitts in and has been revised several times, most recently in The TSCS is the current version of the scale and is available in both child and adult forms The Tennessee Self-Concept Scale (TSCS; Fitts) is a self-report, multidimensional approach to measuring self-concept and consists of self-descriptive items written at a sixth-grade reading level and rated on a point Likert scale (1 = completely false to = completely true). Second, MTMM analyses were adapted to examine the convergent and The Tennessee Self-Concept Scale has been used in two studies to measure identity in people with dementia (Addis & Tippett, ; Naylor & Clare,).
