As a means of cosmetic skin rejuvenation, chemical peels have undergone a period of unfashionability after the advent of laser-based procedures, but are now strongly returning to the forefront of a cosmetic practitioner's armamentarium. This book features extensive basic science, including a discussion of chemical peel-induced histologic changes, the mechanisms of action of the various chemical peeling agents, wound healing, and remodeling features, with an emphasis on newly recognized remodeling cytokines, such as heat shock proteins. They are both flexible and effective, with a histological, chemi-
