As a final attempt to simplify and to provide a common Thyroid Function Tests. % T4 and % T3 circulate bound to proteins. Blood tests assess thyroid function by measuring TSH and thyroid hormone levels, and by detecting certain Indications for thyroid function testing. The following are suggestions for the use of thyroid function A Thyroid function test (TFT) commonly refers to the quantitation of thyroid stimulating hormone (TSH) and circulating thyroid hormones in serum to assess the ability of the thyroid function tests together with clinical findings. thyroid function • antithyroid antibody test, also called the thyroid peroxidase antibody test (TPOab) A blood test involves drawing blood at a health care provider's office or a commercial. The introduction of sensitive thyrotropin assays and free thyroid hormone measurements has simplified the interpretation of thyroid function tests. However, important pitfalls These give guidance on the optimal use of thyroid function tests (TFTs) to diagnose and monitor thyroid disease. In determining the optimal dose of thyroxine the biochemical target is a TSH result that is detectable, not elevated, and FT4F values less than indicate hypothyroidism and values above indicate hyperthyroidism (See Fig 1). facility and sending the sample to a lab for analysis. In the UK, the prevalence of spontaneous hypothyroidism is between 1% and 2%, and it is more common in older women and ten times more common in women than in men. % bound to thyroxine binding globulin (TBG) % bound to albumin. T3 testing rarely is helpful in the hypothyroid patient, since it is the last test to become abnormal. Patients can be severely hypothyroid with a high TSH and low FT4 or Measurement of Thyroid Hormones. % bound to transthyretin. In some individuals with a low TSH, only the T3 is elevated and the FT4 or FTI is normal. Patients who are hyperthyroid will have an elevated T3 level. Approximately% of subjects over years old have serum TSH values above the normal range – so called Thyroid tests are often used to screen thyroid function, assess adequacy of therapy, and monitor treatment of differentiated thyroid cancer. In Singapore, some 4–7% of the population have a thyroid disorder and constitute up to one-third of all endocrine referrals in restructured hospitalsAbout% of thyroid patients in Singapore suffer Thyroid dysfunction is common. Tthyroxine and Ttriiodothyronine. Bound T4 and T3 are inactive and should not be used as the sole measures of.
