

# Translations:3D printed furniture connectors/11/en

---

According to the European Environmental Bureau, every year, the EU produces around 10 tonnes of furniture waste. Authorities are currently looking into the possibility of reusing this furniture waste to produce new items. Digital fabrication can also help with this issue, and in particular 3D printed furniture connectors are an ideal solution to enable reusing discarded furniture to create new ones. The added value of combining reuse practices and digital fabrication consists in allowing individuals to make their own tables, chairs, etc. without requiring specific machines or tools.
