---

Then stick the cylindrical magnets on the half of the cross with two notches to accommodate the magnets. To perform this step correctly, turn the disc you have assembled, and put the two magnets in the holes formed by the washers. This keeps them in place and prevents making mistake in the magnets orientation. Position the other part of the cross on the cylinder by inserting the pins in the two rectangular holes provided for this purpose. And now, put a drop of glue in each of the two notches to accommodate the magnets on the first half of the cross and nest it in the other half, until it is in contact with the disc and the cylindrical magnets.
