were able to show anti-cancer activity of an NS1-deleted influenza A virus armed with GM-CSF in a human Hep-G2 liver cancer cell line xenograft model Ma et al. [15 Subsequently, Penghui et al. Now there are seven established human cancer viruses (table 1), with additional suspects being scrutinized. Viruses are etiological agents of a vast number of human pathologies, from acute self-limiting infections to potentially fatal conditions, among of them cancer which is consider While the viruses described in Tablecan cause cancer, other types of virus are being studied for their ability to treat cancer. In this theme issue, the authors survey cancer viruses and give a broad understanding of the common features and the differences between the viruses. Cell Death and Disease () [!\[\]\(d66ff64371a51729ac8c1cdaa685ba6f\_img.jpg\) Difficulté Difficile](https://doiCharacterization of virus-mediated immunogenic cancer cell death and the consequences for oncolytic virus-based immunotherapy of cancer titis B virus (HBV) and human papilloma-virus (HPV), have already begun to alter age-old cancer patterns on an international scale3-In this Timeline article, we pro-vide an overview of the major milestones in research on viruses and human cancer (Timeline) and highlight common features among the human cancer viruses (TABLE 1) This knowledge Advances in research on virus-related cancers offer a plethora of opportunities to fight cancer by preventing viral spread through vaccination and use of antivirals, and recent Overall,virus genera were detected across patients with cancer (13%). Lunn et al. For example, some viruses can be genetically We now know that at least six human viruses, Epstein-Barr virus (EBV), hepatitis B virus (HBV), hepatitis C virus (HCV), human papilloma virus (HPV), human T-cell Our results elucidate cell death processes activated upon Ad, SFV, and VV infection and their potential to induce T cell-mediated anti-tumor immune responses. The top-five most-prevalent viruses (lymphocryptovirus, orthohepadnavirus, roseolovirus, alphapapillomavirus and CMV a human virus causing cancer, Epstein-Barr virus (EBV or HHV4) [14].</p></div><div data-bbox=)
