 Connected weather station

Étape 1 - Setting up the weather station

Follow the instructions on page 1-4 on tutorial

Étape 2 - Monitoring the values recorded by the station via Blynk

Follow the instructions on page 4-8 on [this](#) tutorial.

Étape 3 - Setting up the flying station

In order to send your weather station up in the air, first of all you'll need to engineer a system similar to that of a hot air balloon. Create a case to accommodate the weather station. This can be made of cardboard or any other material, as long as the weight is not too significant. Beware that helium balloons can only lift very light masses.

Once you've secured the weather station to the case, attach the former to the helium balloons. You may need to use multiple balloons in order to be able to lift the weather station off the ground.

Don't forget to tie some nylon wire to the flying system so that you'll be able to take it back to the ground at any time.

Watch the flying station in action on youtube. Be prepared to stuff some stroke medicine.

Notes et références

List of parts

1x ESP32 weather station

1x helium bottle
1x nylon wire bobbin
several inflatable balloons.
